

Software Requirements Tracking Tool (SReTT)

Project Proposal

Document ID:	Software Requirements Tracking Tool
Origin Date:	Sep 8, 2023
Applicable to:	CIS-580 Data Analytics in Software Engineering. Fall 2023
Student Name:	Luis Castaneda-Trejo
E-mail:	luisct@umich.edu

<div data-bbox="688 197 935 247">Introduction</div> <div data-bbox="152 289 1503 508"><p>System requirements are the descriptions of the services that a system should provide and the constraints on its operations. There are different types and levels of requirements. Stakeholder requirements are at the top level. Then these requirements are divided to create the System Architecture requirements where System Engineers divide them among the main R&D disciplines (Software, Mechanical and Electrical). Each discipline manages their own requirements and divide them among their development teams.</p><p>In big companies, once the software requirements have been received by Software Engineering teams, the Software Architect creates or selects the appropriate framework and architecture that better suits the project based on similar previous projects and from deliverables from the software platform team. Then individual software component requirements are created and given to the software developers for implementation.</p></div> <div data-bbox="152 781 626 831">1.1 Problem Statement</div> <div data-bbox="152 844 1503 1029"><p>In most big companies, every project follows strict development processes to meet product quality. In automotive R&D development there are defined processes like ASPICE that all disciplines must follow if a product goes to production and into the market but sometimes due to high resource rotation, lack of time and inexperience of some development teams, processes are not followed 100%, causing issues with deliverables and documentation.</p><p>One of these issues that is very common is the lack of traceability among different levels of requirements. In software engineering teams, sometimes developers use different words to implement a specification or requirement in code. In automotive programs that implement Functional Safety for example this is a big problem because if the product fails causing damage to the customer, he/she can sue the OEM and there can be big repercussions to it and its TIER1 and 2 suppliers like reputation damage and/or future project cancelations etc.</p></div> <div data-bbox="152 1335 678 1386">1.2 Scope and Objectives</div> <div data-bbox="152 1398 1503 1583"><p>The Software Requirements Tracing Tool (SReTT) is intended to receive a project containing source files and a set of requirements divided in several export files from IBM DOORs. Key words in each requirement will be searched and traced in the source code and the tool will determine if a requirement is likely to be implemented or not. Requirement IDs will also be searched to determine implementation status.</p><p>The tool can be used as part of a continuous integration (CI) strategy or used as a stand-alone tool by developers or other team members to analyze software components. Figure 1 shows a high-level picture of the project elements.</p></div>

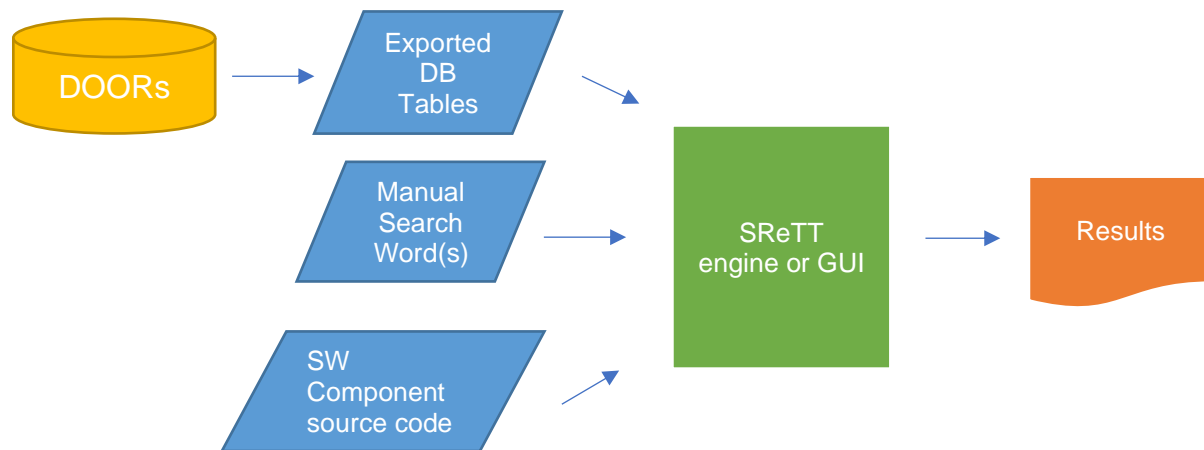

Figure 1. High Level Project Elements

1.3 Task Management

This project will be managed in the following GIT repository:

https://github.com/ecastanedat/CIS_580_Data_Analytics_in_SW_Eng.git

Table 2 shows the overall task list for the project.

TASK	ASSIGNED TO	PROGRESS	START	END
Initiation				
1. Req Definition.	L.Castaneda	0%	9/10/23	9/17/23
2. Python script dev.	L.Castaneda	0%	9/17/23	10/27/23
3. GUI development	L.Castaneda	0%	10/27/23	11/3/23
4. Refactoring and optimization	L.Castaneda	0%	11/3/23	11/8/23
5. Validation and Verif.	L.Castaneda	0%	9/19/23	11/8/23
6. Release and Report	L.Castaneda	0%	11/8/23	11/18/23

Table 2. Project General Task List

1.4 Concept

The user will specify the path to the SReTT tool and input the search words as arguments as seen in Figure 2. The GUI will be developed in LabVIEW, will call SReTT.py with the desired keywords and will present the information in a table. Both options will export and save the information as a comma-separated (.CSV) file.

```
D:\DSUsers\uib01493\000_SD_Card\009_Projects\CIS_580\SReTT>python SReTT.py C:\Users\...\Project_Directory\ Word1 Word2 WordN
=====
SReTT v0.1
This is a demo that only prints the passed arguments from the command line.
=====
SReTT.py
C:\Users\...\Project_Directory\
Word1
Word2
WordN
```

The GUI consists of a 'Project Path' section with a file explorer icon and a text field containing 'C:\Project_Directory'. Below this is a 'Key words to find:' section with a list box containing 'milliseconds', 'Word2', and 'WordN'. To the right is a 'Results' table with five columns: 'Word', 'Code Line #', 'Implemented', 'Reliability %', and 'Function Name'. The table has 15 empty rows. A 'START' button is located at the bottom right of the GUI.

Word	Code Line #	Implemented	Reliability %	Function Name
